

Case Study: Advantages of Using AI in Government and Public Sector

Title Page

Assignment Title: A10: Advantages of using AI in Government and Public Sector

Name: Trevion Duncan

Introduction

AI is becoming a big part of how the government gets things done. It helps workers get through information faster, make better decisions, and do their jobs more efficiently. Instead of people having to go through thousands or even millions of records by hand, AI can do it in a fraction of the time. Governments are already using AI for things like healthcare, disaster response, catching fraud, and making cities run better. In this paper, I'm going to talk about one example of how AI is being used by the government and then explain another way I think AI could make public services even better.

Case Study Analysis

AI Used to Catch Tax Fraud

One example of AI being used by the government is the IRS using it to help catch tax fraud. Every year, millions of people file their taxes, and it would be almost impossible for workers to check every single return. AI helps by looking through all of that information and finding anything that seems suspicious.

The biggest problem the IRS is trying to solve is people filing fake tax returns or stealing someone else's identity to get a tax refund. That ends up costing the government a lot of money every year.

The AI looks at tax returns and compares them to older records to see if something doesn't seem right. If it finds something unusual, it sends that return to an IRS employee so they can take a closer look. The more fraud the AI finds, the better it gets at recognizing similar scams in the future.

Using AI has helped the IRS catch fraud faster and stop fake refunds before they get paid out. It also saves employees a lot of time because they can focus on the returns that actually look

suspicious instead of checking every return one by one. That makes the whole process faster and helps protect honest taxpayers.

Even though AI has been helpful, it isn't perfect. Sometimes it can flag people who didn't do anything wrong, which can slow down their tax refund. There are also concerns about keeping everyone's personal information safe and making sure the AI isn't making unfair decisions.

My AI Idea

I think AI could also help make traffic a lot better in cities. Anybody who has ever been stuck in traffic knows how frustrating it can be. It wastes time, burns more gas, and causes more pollution.

Instead of traffic lights running on the same timer all day, AI could use traffic cameras, road sensors, and GPS information to figure out where traffic is building up. Then it could change the traffic lights in real time to help keep cars moving. It could also warn drivers about accidents or road closures and suggest a faster route.

I think this would save people a lot of time, reduce traffic jams, and even help emergency vehicles like ambulances get where they need to go faster. It could also help lower pollution because people wouldn't be sitting in traffic with their cars running as long.

Of course, there would still be a few challenges. Setting up the technology would cost a lot of money, and cities would have to make sure they protect people's privacy. The AI system would also need regular updates to keep working the way it's supposed to.

Conclusion

Overall, I think AI can really help governments do a better job. The IRS is already using it to catch tax fraud faster and save money, and that's just one example. There are still some problems that need to be worked out, like protecting people's information and making sure AI doesn't make mistakes. Even with those challenges, I think AI has a lot of potential to improve government services. As technology keeps getting better, I think we'll see AI being used in even more ways to make life easier for everyone.
